

Enhance CREATE DATABASE by adding WITH INTEROP and WITH ANALYTICS options

While it's very convenient to use the `CREATE DATABASE` command to quickly create a namespace with two databases suffixed with D for data and C for code, it would also be useful to add options to automatically make this namespace immediately available for interoperability and analytics.

Therefore, I suggest adding options to automate the creation of a portal application with the Analytics option enabled and the addition of interoperability-related mappings, avoiding the need to manually execute `##class(%EnsembleMgr).EnableNamespace("namespace")`.

I also propose adding an option that allows the resources associated with each database (ie: %DB_DBNAME) to be automatically created to prevent the databases from relying on the %DB_%DEFAULT resource.

The final command might then look like this:

```
CREATE DATABASE dbname [ON DIRECTORY pathname]  
    [WITH [ENCRYPTED_DB] [GLOBAL_JOURNAL_STATE [=]  
{YES | NO}] [INTEROPERABILITY] [ANALYTICS]  
    [DB\_RESOURCE]]
```
